### **Engineering Calculation** Nitin Kanani

2020-03-02 Engineering economics, previously

known as engineering economy, is a subset of economics concerned with the use and "...application of economic principles"[1] in the analysis of engineering decisions.[2] As a discipline, it is focused on the branch of economics known as microeconomics in that it studies the behavior of individuals and firms in making decisions regarding the allocation of limited resources. Thus, it focuses on the decision making process, its context and environment.[1] It is pragmatic by nature, integrating economic theory with engineering practice.[1] But, it is also a simplified application of microeconomic theory in that it avoids a number of microeconomic concepts such as price determination, competition and demand/supply.[1] As a discipline though, it is closely related to others such as statistics, mathematics and cost accounting.[1] It draws upon the logical framework of economics but adds to that the analytical power of mathematics and statistics.[1] Engineers seek solutions to problems, and the economic viability of each potential solution is normally considered along with the technical aspects. Fundamentally, engineering economics involves formulating, estimating, and evaluating the economic outcomes when alternatives to accomplish a defined purpose are available.[3] In some U.S. undergraduate civil engineering curricula, engineering economics is a required course.[4] It is a topic on the Fundamentals of Engineering examination, and questions might also be asked on the Principles and Practice of Engineering examination; both are part of the Professional Engineering registration process. Considering the time value of money is central to most engineering economic analyses. Cash flows are discounted using an interest rate, except in the most basic economic studies. For each problem, there are usually many possible alternatives. One option that must be considered in each analysis, and is often the choice, is the do nothing alternative. The opportunity cost of making one choice over another must also be considered. There are also non-economic factors to be considered, like color, style, public image, etc.; such factors are termed attributes.[5] Costs as well as revenues are considered, for each alternative, for an analysis period that is either a fixed number of years or the estimated life of the

project. The salvage value is often forgotten, but is important, and is either the net cost or revenue for decommissioning the project. Some other topics that may be addressed in engineering economics are inflation, uncertainty, replacements, depreciation, resource depletion, taxes, tax credits, accounting, cost estimations, or capital financing. All these topics are primary skills and knowledge areas in the field of cost engineering. Since engineering is an important part of the manufacturing sector of the economy, engineering industrial economics is an important part of industrial or business economics. Major topics in engineering industrial economics are: The economics of the management, operation, and growth and profitability of engineering firms; Macro-level engineering economic trends and issues; Engineering product markets and demand influences; and The development, marketing, and financing of new engineering technologies and products.

### Trans Structures: Fluid Architecture and Liquid Engineering

Matyas Gutai 2015-01-15 Architecture is based upon the misconception that strong is stable, both in sense of energy and structure, as an unchanged state of microclimate would require more material or insulation. Trans-structures are the opposite: building elements with the response-ability to change according to external conditions in order to maintain stability in terms of structure and/or

energy. In this type of building, any effect (structural or thermal load) would generate an immediate affect (a response of the structure). Energy and weight would be counteracted and on a total scale, change would not occur. Such buildings are always in transition from one state to another, unlike conventional structures.

*Civil Engineering License Review* Donald G. Newnan 1980 A review specifically for the latest version of the Civil Engineering/Professional Engineer Exam. **Engineering Economy in Upstream Oil & Gas Field Development** Menglan Duan 2020-12-10T00:00:00+01:00 The business of upstream oil and gas industry is a complex process that involves multidisciplinary participation. Producing crude oil and natural gas from the subsurface reservoir rocks to the point of the selling terminal requires stage by stage processes that costs several hundreds of millions of dollars to the operating companies. Because of the capital intensive nature of upstream investments, every required process is challenged of its economic impact or benefits it will have on the project's net present value (NPV). The techniques applied in determining the economics of these processes and their selection criteria are addressed in the book. This book guides the reader through these strategic

processes, and presents the participants involved in the business of upstream oil and gas prospecting and the conditions that dictate the field development and investment decisions by investors. It also reveals the shared interests and relationships that exist between international oil companies (IOCs) and national oil companies (NOCs) in the exploration and exploitation of their hydrocarbon resources and reserves. This text will serve the purpose of teaching and learning to those in the energy and financial sectors, as the methods, tools, and techniques discussed throughout the chapters will equip students, tutors, experts, and professionals with the necessary skills and knowledge of Exploration and Production (E&P) projects and energy financing and investment. The principles of project management as it applies in upstream oil/gas projects are discussed as well. And the criteria for project ranking, selection, and budgeting which are sine qua non to project financing and execution are well documented in this book.
